

NMRA Technical Note	
Layout Command Control™ (LCC)	
Common Information	
Apr 25, 2021	TN-9.7.0.2

Adopted as a NMRA Technical Note

The OpenLCB Standard document appended to this cover sheet has been formally adopted as a NMRA Standard by the NMRA Board of Directors on the date shown in the *Adopted* column in the *Version History* table below.

Version History

Date	Adopted	Summary of Changes
Feb 17, 2015	Feb 20, 2016	Initial version submitted for public comment
Apr 25, 2021	July 2, 2021	Changed LCC logo to include the ® symbol Changed “Layout Command Control” to have the ™ symbol Added the NMRA Legal Disclaimer fine-print Changed the OpenLCB license to “Creative Commons Attribution-ShareAlike 4.0 International”

Important Notices and Disclaimers Concerning NMRA Standards Documents

The Standards (S), Recommended Practices (RP), Technical Note (TN) and Technical Information (TI) documents of the National Model Railroad Association (“NMRA Standards documents”) are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page, appear in all standards and may be found under the heading “Important Notices and Disclaimers Concerning NMRA Standards Documents.”

Notice and Disclaimer of Liability Concerning the Use of NMRA Standards Documents

NMRA Standards documents are developed within the Standards and Conformance Department of the NMRA in association with certain Working Groups, members, and representatives of manufacturers and sellers. NMRA develops its standards through a consensus development process, which brings together volunteers representing varied viewpoints and interests to achieve the final product. NMRA Standards documents are developed by volunteers with modeling, railroading, engineering, and industry-based expertise. Volunteers are not necessarily members of NMRA, and participate without compensation from NMRA.

NMRA does not warrant or represent the accuracy or completeness of the material contained in NMRA Standards documents, and expressly disclaims all warranties (express, implied and statutory) not included in this or any other document relating to the standard or recommended practice, including, but not limited to, the warranties of: merchantability; fitness for a particular purpose; non-infringement; and quality, accuracy, effectiveness, currency, or completeness of material. In addition, NMRA disclaims any and all conditions relating to results and workmanlike effort. In addition, NMRA does not warrant or represent that the use of the material contained in NMRA Standards documents is free from patent infringement. NMRA Standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

Use of NMRA Standards documents is wholly voluntary. The existence of an NMRA Standard or Recommended Practice does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the NMRA Standards documents. Furthermore, the viewpoint expressed at the time that NMRA approves or issues a Standard or Recommended Practice is subject to change brought about through developments in the state of the art and comments received from users of NMRA Standards documents.

In publishing and making its standards available, NMRA is not suggesting or rendering professional or other services for, or on behalf of, any person or entity, nor is NMRA undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any NMRA Standards document, should rely upon their own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given NMRA Standards documents.

IN NO EVENT SHALL NMRA BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: THE NEED TO PROCURE SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD OR RECOMMENDED PRACTICE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

Translations

NMRA’s development of NMRA Standards documents involves the review of documents in English only. In the event that an NMRA Standards document is translated, only the English version published by NMRA is the approved NMRA Standards document.

Official Statements

A statement, written or oral, that is not processed in accordance with NMRA policies for distribution of NMRA communications, or approved by the Board of Directors, an officer or committee chairperson, shall not be considered or inferred to be the official position of NMRA or any of its committees and shall not be considered to be, nor be relied upon as, a formal position of NMRA.

Comments on Standards

Comments for revision of NMRA Standards documents are welcome from any interested party, regardless of membership. However, **NMRA does not provide interpretations, consulting information, or advice pertaining to NMRA Standards documents.**

Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since NMRA standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, NMRA, its departments, Working Groups or committees cannot provide an instant response to comments, or questions except in those cases where the matter has previously been addressed. For the same reason, NMRA does not respond to interpretation requests. Any person who would like to participate in evaluating comments or in revisions to NMRA Standards documents may request participation in the relevant NMRA working group.

Laws & Regulations

Users of NMRA Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any NMRA Standards document does not constitute compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. NMRA does not, by the publication of NMRA Standards documents, intend to urge action that is not in compliance with applicable laws, and NMRA Standards documents may not be construed as doing so.

Copyrights

NMRA Standards documents are copyrighted by NMRA under US and international copyright laws. They are made available by NMRA and are adopted for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of modeling, structural and engineering practices and methods. By making NMRA Standards documents available for use and adoption by public authorities and private users, NMRA does not waive any rights in copyright to the NMRA Standards documents.

IMPORTANT NOTICE

NMRA Standards documents do not guarantee or ensure safety, security, health, or environmental protection, or ensure against interference with or from other systems, devices or networks. NMRA Standards documents development activities consider research and information presented to the standards development group in developing any safety recommendations. Other information about safety practices, changes in technology or technology implementation, or impact by peripheral systems also may be pertinent to safety considerations during implementation of the standard. Implementers and users of NMRA Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.

OpenLCB Technical Note

Common Information

Apr 25, 2021

Adopted

1 Introduction

The OpenLCB Standards are independently normative. That is, each document contains statements that assert how things should or ought to be, and each document is written to be self consistent. In general, documents marked as Standards focus on explicit requirements and assertions, while Technical Notes provide non-binding context and rationale; to avoid confusion, the terms Normative and Informative are liberally used in section headings.

This Technical Note provides common background information that may be useful as you read existing Standards and Technical Notes, and may provide useful guidance as you write new ones.

This Technical Note is not normative in any way.

2 Data

2.1 Reserved fields

When **sending** a message, set reserved fields to zero value unless otherwise specified. When **transporting** a message, transport reserved quantities unchanged.

When **receiving** a message, consult the Standard: reserved fields come in two flavors. One is “reserved, send as zero, **ignore upon receipt**”. This means that a receiving node shall process the message, ignoring the value in the reserved field (or assuming it was the default value of zero). Some future extension or additional information may not be available, but the interaction can be continued without it. The other flavor is “reserved, send as zero, **check upon receipt**”. This means that if the receiving node finds a non-zero value in that field, it must abort processing the message, not perform any action requested by it, and if appropriate, should respond with an error code, preferably some form of “unimplemented”. Future versions of the standard may define the bits marked with “check upon receipt” in a way that is incompatible with previous versions of the standard, including giving the rest of the message a completely different meaning when the reserved field is not the default value.

The zero value sometimes indicates a non-initialized value.

2.2 Numerical representation

Unless otherwise specified, OpenLCB fields are unsigned.

OpenLCB does not define a floating point representation. IEEE half-size (16 bit) floats are used in e.g. the Throttle protocols under development.

2.3 Byte sequences

Bytes are defined as 8 bits.

OpenLCB is, by default, big-endian. When sending multi-byte data, the byte containing the most significant bits is sent first. This is the same as the CAN header, Ethernet and the common internet protocols, but not the same as the Intel x86 architecture.

- 35 When a sequence of bytes is being documented or described, the first or most significant is labeled 0, the next is labeled 1, etc. This results in phrases like “byte 0” and “the first byte” referring to the same thing.

2.4 Bit sequences

- 40 The OpenLCB protocol descriptions use LSB 0 coding, where the the least significant bit in any word, byte or field is numbered 0, with bits to the left (toward the MSB) then given higher numbers.

Although “first bit” properly denotes the most-significant bit of the field being discussed, “second bit” refers to the bit adjacent to the first bit, etc, it is better to refer to “most significant bit” rather than “first bit”.

- 45 The CAN specification and some layout-level protocols, such as NMRA DCC and Digitrax Loconet, use LSB 0 coding. That's the primary motivation for the choice of LSB 0 for OpenLCB. Unfortunately, MSB 0, where the most-significant bit is labelled with 0, is what's used for many protocol specifications, including the RFC series of protocols and the Ethernet definition. It's unfortunate that there's no single convention that OpenLCB could adopt to be consistent with the entire world, but there isn't.

50 2.5 Strings

OpenLCB strings are sequences of UTF-8 values¹. This allows OpenLCB devices to represent all the international writing systems that are described by Unicode² with only a small processing burden in the most common (Western alphabet) case.

- 55 OpenLCB does not prefer length-coded or null-terminated strings. Standards should specify which is used in each case.

OpenLCB uses newline, also known as line-feed (`\n 0x0A`) as the line-end character within strings. Carriage return (`\r 0x0D`) should be considered as general white space.

There are no specific tab settings. You cannot assume a tab is any particular number of spaces. You can assume it counts as non-null white space.

- 60 Certain standards retain the 0x80 bit in the first byte as a way of eventually indicating other codings, particularly compression of the UTF-8 text. If this is possible, it's specified in the relevant standard. For example, XML CDI strings can start with either the UTF-8 text for “<?xml” which starts with 0x3C, or with a 0x80 followed by an indication of the format of the compressed UTF-8 text that follows. See the individual standards for more information.

¹For an introduction to UTF-8 coding and how it represents international character sets, see e.g. <http://en.wikipedia.org/wiki/UTF-8>

²From the glossary of the Unicode standard, <http://www.unicode.org/versions/Unicode6.1.0/ch03.pdf#G7404> : “UTF-8: A multibyte encoding for text that represents each Unicode character with 1 to 4 bytes, and which is backward-compatible with ASCII. UTF-8 is the predominant form of Unicode in web pages.” See sections 3.9 and 3.10 in the Unicode specification, link above.

65 3 Presentation

OpenLCB documents use the prefix “0x” to indicate a hexadecimal value. Hexadecimal values are presented with capital letters: 0xAB not 0xab. A sequence of bytes only requires the “0x” prefix on the first byte: 0x12 34 56 78.

OpenLCB documents use the prefix “0b” to represent a binary value.

70 Octal representations are not used.

The boolean values are “true” and “false”.

Constants should always include the full field length. A value for a 12-bit field should be written as 0x002 or 0b000000000010, not 0x2 or 0b10.

75 Commas can be used in numbers after decimal thousands (65,523), 16-bit double-bytes for hex constants (0x1234,4567), and four-bit nibbles in binary (0b1000,0000). Do not put a space after the comma.

80 Byte sequences for specific quantities, including both Unique ID (node ID) and Event ID values, should be shown in dotted-hex format e.g. “01.AB.34.01.CD.E3”. General byte sequences that don't represent a single value should be in spaced-hex format, e.g. “01 02 AB DE 00 00”. It's recommended that leading zeros be provided on output, but not required on input. Dotted-decimal should not be used unless it's made very clear that that is the case.

3.1 Presentation of CAN Quantities

The 29-bit CAN extended header is presented as a single hex string: 0x0000,0000. The active bits are at the right side, so that the highest possible value is 0x1FFF,FFFF.

85 “sss” is used to represent the source node ID alias in a CAN frame.

“ddd” is used to represent the destination node ID alias in a CAN frame.

A sample CAN header with both source and destination node addresses might be: 0x1Fdd,dsss or 0x1Fdddsss.

90 The data content of a frame is presented as a sequence of individual bytes. A typical complete frame might be then 0x1FFFFsss 01 02 03 04.

3.2 Presentation of an OpenLCB message

OpenLCB messages are described in this common format:

Name	Description	Simple Node	Dest ID	Event ID	Common MTI	Data Content
	(optional field)	N	N	N	0x0000	

95 • Name: Standard name of the message.

100

- Description: Optional field, generally used if there is variant forms.
- Simple Node: Whether the message is included in the “simple node subset” (defined in the Message Networking TN).
- Dest ID: Whether this message includes a destination address for a specific node. If not, the message is global.
- Event ID: Whether this message includes an Event ID.
- Common MTI: The 16-bit value, typically in hex notation, of the full Message Type Indicator.
- Data Content: Summary description of data bytes, if any, included after fixed fields such as MTI and destination address.

105

Adaptation to CAN messages are described in this format:

Name	Description	CAN-MTI	CAN Header	Data Content
	(optional field)	0x000 (optional field)	0x1800,0sss	fddd

110

- Name: Standard name of the message.
- Description: Optional field, generally used if there is variant forms.
- CAN-MTI format: Typical CAN frame representation of the MTI. Optional field, used only if the CAN-MTI is not equal to the low 12 bits of the Common MTI.
- CAN Header: Contains the CAN header. Source node ID alias is represented by “sss”. Destination node ID alias, if present, is represented by “ddd”.
- Data Content: Summary description of data bytes, if any. For addressed messages, also include the fixed destination address format, represented as “fddd”, where the “f” represents fragmentation flags.

115

Note that this information is not completely independent. The MTI value depends on simple subset, priority subgroup, etc, values. The messages are detailed in specific associated documentation. That documentation is considered normative.

For more information, see the various “Message Networking” Standards and Technical Notes.
